The budget performance is crucial in patient care as it determines efficiency in provision of equipment and resources in the patient care activities. Budgets which have been known to perform often avail adequate resources in terms of funds which will be used to purchase all necessary resources and furnish the facilities. Such a budget ensures that there is adequate cash at hand for emergency issues as well as cash at the bank to handle complex issues. The patients who are treated in health care facilities where the budget performance is commendable are likely to receive better health care as the facilities will not be overstretched to cover each patient. The strategies involved in development of the budget performance are more likely aimed at improved patient care as a result of even distribution of resources (Gapenski, 2008).

Budget performance also has a direct impact on employee satisfaction as the employees will be assured of reliable supply of resources in their line of work. This will be made possible by the fact that employees will not have to worry of reduced efficiency due to scarce resources which are not replaced in time. Employees are also satisfied when the assurance that their duties will not be hampered by lack of funds to buy new stock due to presence of a non-performing budget. Commendable budget performance makes it easier for the employees to concentrate on their duties rather than on the inadequate resources hence the output is positive due to satisfaction in their present situation (Finkler and Ward, 2006).
